

# New Horizons in Rig PM's

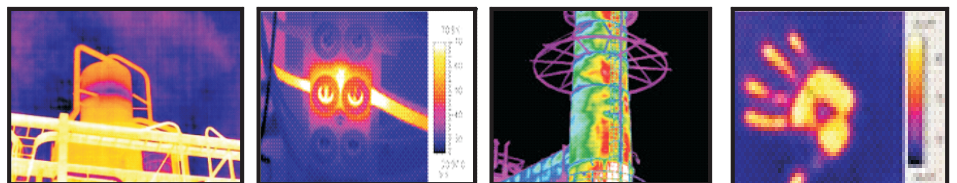

## Offshore Thermal Imaging Services

Detect failing & defective offshore electrical & mechanical equipment by its heat signature - before an incipient faulty becomes a downtime incident.

Geo Therm Ltd - the leading offshore contractor for thermal imaging surveys.

Thermal infrared Imaging is identified as the most diverse condition monitoring technique available today. Used to identify the condition of electrical, mechanical and process related systems to reveal problems & defects that are undetectable to the human eye, unless a fault is glowing cherry red! Our thermal infrared hot-spot surveys are fast, non invasive (allowing your rig ops to continue), and are incredibly effective and competitively priced permitting the capture of real time data to produce survey reports that your maintenance departments can act on, preventing rig down time from occurring.

Geo Therm Ltd retro fit inspection sight glass windows into electrical panel doors allowing safer everyday visual & annual 'hot-spot' thermal imaging surveys, without the need to open and expose work crew to live electrics & explosive arc flash.

Operating in the North Sea, North & West Africa, Gulf of Mexico, Arabian Gulf, Caspian and South China Seas.
